

## Oil Comment: Hedging Escalation With Diesel Length

- **Lower Gulf flows means higher prices.** Escalation in the Middle East and the decline in estimated Persian Gulf flows to below 45% of pre-war levels have pushed oil prices back up ([Exhibit 1](#)). The Brent futures curve is now modestly above our \$80/75 forecasts for 2026Q4/2027, which assume de-escalation in 2026Q4.
- **Upside price risks.** We see risks to our price forecast as tilted to the upside on net, especially in the near term ([Exhibit 2](#)). The key upside price risks are:
  - *Shipping disruptions in Hormuz—and potentially the Red Sea—as the estimated 5mb/d rise since the start of the war in pipeline flows via Yanbu to the Red Sea, to more than 6mb/d ([Exhibit 3](#)), has played a key role in offsetting part of the decline in Hormuz flows.*
  - *Damage to energy infrastructure from the Middle East and Russia-Ukraine wars.* While the Iran war has likely not caused lasting major damage to oil production capacity so far, our analysis of the 5 largest prior supply shocks [shows](#) an average 42% hit to production in the affected country after 5 years, often reflecting infrastructure damage, underinvestment, or tight sanctions ([Exhibit 4](#)).
- **Lower stocks vs. greater flexibility.** Brent might exceed \$120/bbl in 2026Q4 and average \$100 in 2027 if Hormuz remains disrupted through 2027 ([Exhibit 2](#), red line). This scenario assumes Gulf output only fully recovers by Dec27, supported by pipeline extensions. The estimated Q2 inventory draw of more than 3mb/d leaves the market more vulnerable than in February, with inventories particularly low for OECD diesel and OECD SPR ([Exhibit 5](#)). Still, global visible oil stocks are down only 0.3mb/d year-over-year ([Exhibit 6](#)), and the simulated price upside is less high than comparable estimates from the start of the war. This reflects that we now assume greater demand elasticity, more adaptable Mideast supply, and a higher market tolerance for low inventories before it requires aggressive demand destruction.
- **China has helped stabilize crude markets.** The decline in crude import demand remains especially large for China ([Exhibit 7](#)), where demand appears highly sensitive to crude purchase prices ([Exhibit 8](#)). The 4.7mb/d year-over-year (YoY) decline in China crude net seaborne imports in June reflects both weaker refinery runs and products demand (China retail gasoline sales volumes fell 21% year-over-year), and a shift from stockpiling in 2025 to destocking since the start of the war, with crude destocking estimated at just over 1mb/d in June ([Exhibit](#)

9). In our view, China crude imports need not rebound immediately, especially if prices were to rise further, given still-elevated estimated China oil inventories of roughly 2 billion barrels and its ability to substitute some oil demand by coal and power.

- **Hedging escalation with diesel length.** We recommend that investors and consumers seeking to hedge persistent geopolitical shocks in the Mideast and Russia go long the Dec26-March27 European diesel (“gasoil”) timespread. This spread has potential to rise further—or “roll up” strongly—(Exhibit 10) given fundamental tightness even absent the Iran war, and high exposure to Russia and Mideast refinery outages. We prefer European diesel timespread length to crude, gasoline, or US diesel length for three reasons.
  - **Diesel timespreads over crude.** Unlike the crude market, refining and diesel markets were already very tight before the war, with high refining utilization and low diesel stocks (Exhibit 11). As Ukraine continues to scale decentralized drone production, the persistence of record-high Russian refinery outages of nearly 5mb/d (Exhibit 12) is highly plausible, which would likely keep Russia diesel net exports very low (Exhibit 13). Hurricanes, extreme summer heat, and year-to-date significant deferrals in planned maintenance also pose greater downside supply risk to products than to crude.
  - **Diesel over gasoline.** We recommend diesel length over gasoline length because Russia refinery outages cause more price upside for diesel than for gasoline, diesel margins tend to rise disproportionately when inventories fall from low levels, diesel demand is less price-elastic and has yet to reach its seasonal peak in Q4, and refiners have limited capacity to raise diesel yields further (Exhibit 14).
  - **European diesel over US diesel.** We prefer European diesel over US diesel length because US margins face downside risk from potential policy changes, including export tariffs or lifting of the US Renewable Volume Obligation (RVO), while European refining costs face upside risks, including higher TTF prices.

We combine estimates of domestic production from the IEA, net imports and visible changes in stocks from Kpler and Petrologistics, crude demand (i.e. refinery runs) from NBS, and refined products demand from S&P Global Market Intelligence. We assume China condensate production of 0.2mb/d and use Petrologistics estimates for pipeline crude imports of 0.8mb/d and railroad refined products imports of <0.1mb/d.
