

Global LNG Analyzer

Asia leads, Europe to catch up

- Global LNG imports held up better than expected in June, supported by a recovery in Asian demand.** Global LNG imports averaged 1,507 Mcm/day in June, down only 27 Mcm/day (1.8%) YoY. After months of decline and broadly flat YoY trend in May, China's LNG imports rose 5 Mcm/day (2%) YoY in June. Demand recovery was broad-based across Asia (ex-China/JKM), as imports increased 32 Mcm/day, or 9%, YoY, led by India (+21 Mcm/day, +22% YoY) and Thailand (+12 Mcm/day, +38% YoY), likely driven by the upcoming El Niño and increased cooling needs. JKM demand, meanwhile, has remained broadly stable at around 340–350 Mcm/day over the past three months, suggesting that domestic energy systems have partly adjusted through greater coal use, particularly in the power sector. Egypt also retained strong import momentum, with LNG imports reaching a new high of 60 Mcm/day (+10 Mcm/day MoM, +37 Mcm/day YoY).
- With Asia absorbing more spot LNG, European imports lag significantly.** European LNG imports declined by 80 Mcm/day (-20%) YoY in June. As we have been highlighting through our supply and shipping trackers, this reflects the pull from higher JKM/TTF premiums, which peaked near \$4/MMBtu at the onset of the conflict and remained elevated around \$2/MMBtu before the ceasefire announcement, and still trades at around \$1.3/MMBtu since the ceasefire. Ongoing robust premiums have redirected marginal US spot cargoes towards Asia rather than Europe, as the European share in US spot LNG imports dropped to nearly 50% in June, compared to 65% in June-2025.
- Our spot LNG model underscores the same rebalancing pattern.** Overall, estimated Asian spot LNG imports reached a new high of 290 Mcm/day in June, at the expense of European destinations, where spot volumes fell to 192 Mcm/day. This compares with 215 Mcm/day in June 2025, when NWE storage stood at 43%, versus 30% in 2026 (both as of June 1). Despite the post-ceasefire decline in spot prices, the core market fundamentals remain broadly unchanged as the JKM premium is proving resilient and continuing to pull spot cargoes toward Asia, while Europe's storage trajectory continues to lag.
- The recovery in demand was made possible by stronger-than-expected global LNG supply.** The upside was led by the US, and particularly Sabine Pass, where feedgas and loading profiles showed little evidence of the usual June seasonal maintenance. We estimate Sabine Pass exports were 31 Mcm/day higher in June, essentially skipping the seasonal maintenance, while total US LNG exports averaged 505 Mcm/day (+31% YoY). As a result, global LNG exports declined by only 15 Mcm/day YoY in June, a much smaller contraction than the roughly 100 Mcm/day decline seen in April–May and the 150 Mcm/day decline in March.
- Robust June supply also shifts the overall disrupted balance.** At the onset of the conflict, we estimated that alternative supply could offset up to half of the lost Qatar/UAE LNG volumes, an estimate which largely held true through the first three months of the conflict (Mar-May). However, incorporating the much more modest decline in global LNG supply in June, the March to June average offset is now closer to two thirds. More specifically, against a 300 Mcm/day decline in Qatar/UAE supply, alternative sources offset 200 Mcm/day, led by the US (+87 Mcm/day) and Canada/ Mexico (+45 Mcm/day).

- **However, we still expect LNG supply growth to moderate from here.** Much of the forecasted 2026 supply growth (ex. Qatar/UAE) have already been delivered by the projects that started up in 2025, meaning their YoY contribution naturally fades as we move through the second half. Plaquemines is the clearest example: it remains the largest single contributor to 2026 growth, but 75% of its expected annual increase has already materialized YTD. Similar base effects will emerge for LNG Canada and Arctic LNG 2 as they approach their 2025 start-up anniversaries, while Golden Pass continues to miss expectations.
- **Our view on the Qatar ramp-up pace is unchanged.** Assuming no re-closure or further incidents around the Strait of Hormuz, we model Qatari LNG utilization to reach 83% (the new normal, given the two damaged trains) in August and current events in the region potentially indicate further delay risks. Based on loading data, we estimate Qatar utilization averaged close to 16% in June. However, given limited traffic through Hormuz toward month-end, export-based utilization was closer to 10%. We model an average utilization rate of 50% in July, 62% in August, and 83% from September onward. Under these assumptions, Qatar's 2026 annual utilization would average near 58%, equivalent to 50 Bcm decline in annual exports versus 2025.
- **Paced Qatari restarts, slowing ex-Middle East supply growth, low Golden Pass utilization and resilient Asian demand leave Europe in a difficult position ahead of winter.** Supply risks to Europe are further complicated by potential upside to Asian LNG demand from El Niño related cooling needs. At the same time, on-the-ground fundamentals on the continent show record low storage levels with a trajectory that deteriorates day after day compared to last year's path (which was the lowest since 2022). Additionally, the hottest summer on record (since at least 1973) also raises power system risks and increases the call on gas-fired generation, not only to meet rising cooling demand but also to offset weaker output from heat-sensitive alternative sources such as wind, hydro, nuclear and potentially even coal/lignite.
- **Taken together, these factors point to either structurally tight 3Q balances...** In our view, the market will require higher prices and TTF/JKM spreads for Europe to outbid Asia for spot LNG cargoes, incentivize the maximum feasible coal use in the power sector and ultimately correct the storage trajectory. We think the market is already moving in that direction. Like other fossil fuels, spot natural gas prices fell sharply after the ceasefire (gas -20%, oil -13%, coal -11% Jun 10-19). However, unlike other fossil fuels, gas prices have since recovered by 12%, while oil and coal have continued to weaken (oil -10%, coal -2%, Jun 19 to date).
- **...or significant risks into 4Q and winter.** Last winter, Europe relied on winter LNG availability rather than building storage ahead of the heating season, contributing to a nearly 50% price spike in January during a short-lived transatlantic cold spell. This winter, with storage potentially at the lowest level on record, prices already elevated, Hormuz risks higher, normal weather risks still present and El Niño uncertainty on top, price moves could be much bigger. In that context, betting on El Niño to deliver a mild winter on the continent may prove too optimistic and could come at a high cost.

3Q balance remains structurally tight

After the initial shock, when Asia lost almost 30% of its LNG supply and the adjustment had to come largely through demand, the region is now absorbing more spot cargoes despite still elevated spot prices. Somewhat contrary to expectations, the largest demand decline has been in Japan and South Korea, where Apr to Jun imports averaged around 40 Mcm/day lower YoY, as domestic energy systems, particularly power generation, adjusted toward alternative fuels such as coal. In China, LNG demand weakened again in 1Q26 after signs of recovery in late 4Q last year, but appears to have troughed in March. Since then, demand has increased by almost 100 Mcm/day into June and recorded its first YoY increase (**Figure 2**). Demand is also picking up across the rest of Asia (ex. China/JKM). Beyond established buyers such as India and Thailand, imports have also strengthened in Indonesia and Vietnam, which we largely attribute to hotter weather and rising El Niño related cooling risks. It is difficult to disentangle how much of the imported LNG has already been consumed and how much is being held back for rainy (or very hot days) in July and August, but we think Asian summer demand remains skewed to the upside (**Figure 3**).

The strength in Asian imports is a direct consequence of persistent JKM premiums over TTF. The spread peaked near \$4/MMBtu at the onset of the conflict and averaged around \$2/MMBtu in 2Q. Despite the announced ceasefire and the decline in flat prices, the premium has not dissipated materially and continues to trade around \$1.1-1.3/MMBtu. Based on our estimates of shipping and other costs for the next couple of months, Asia and Europe imply broadly similar netbacks, with a more visible European premium emerging only from October (**Figure 4**).

Figure 4: JKM/TTF differentials history

As a result, Asian spot imports reached a new historical high in June at nearly 300 Mcm/day, while European spot imports fell below 200 Mcm/day (**Figure 6 and Figure 7**). We still expect Europe to correct this imbalance by eventually outbidding Asia and re-emerging as the preferred destination for marginal spot cargoes. So far, however, the gap between actual and required European imports continues to widen. In our view, Europe can still correct the storage path, but this requires higher TTF prices and a narrower JKM premium.

The robust Asian imports were largely enabled by stronger-than-forecast US supply (**Figure 8**). US LNG exports averaged 505 Mcm/day in June (+31% YoY). The upside was largely driven by Sabine Pass (+35 Mcm/day YoY), as the facility effectively skipped its usual seasonal maintenance. In our view, and consistent with historical patterns, this maintenance is unlikely to be avoided and more likely to be deferred, implying that supply growth should moderate in July and August (**Figure 9**).

Outside Sabine Pass, output was also stronger at Corpus Christi (+27 Mcm/day YoY), and Plaquemines (+39 Mcm/day YoY), as both facilities continued to ramp up and came in slightly above our expectations. Cameron provided additional support, up around 10 Mcm/day YoY. This helped limit the YoY decline in global LNG exports to only around 15 Mcm/day in June, compared with roughly 100 Mcm/day in April and May and around 150 Mcm/day in March.

Figure 8: US LNG exports

Source: Bloomberg Finance L.P., J.P. Morgan Commodities Research

Figure 9: Sabine pass feedgas flows

Source: Bloomberg Finance L.P., J.P. Morgan Commodities Research

The significant recovery in global LNG supply (ex. Qatar/UAE) materially reshaped the post-conflict balance. Our expectation at the onset of the conflict was that rising alternative supply could offset around half of lost Qatar/UAE volumes, which largely materialized through May. However, the stronger June supply response brings the March to June average offset closer to two-thirds. Against a 300 Mcm/day decline in Qatar/UAE supply, alternative sources offset close to 200 Mcm/day, led by the US and Canada/Mexico (**Figure 10**).

On the demand side, the primary balancing factor remains Europe. European LNG imports declined by 80 Mcm/day YoY in June, an acceleration from the 51 Mcm/day YoY decline in May, as the continent emerges almost like residual balancing market (**Figure 11**).

Figure 10: Global LNG market rebalancing

Figure 11: Global LNG supply/demand changes

Mcm/day YoY

Source: Bloomberg Finance L.P., J.P. Morgan Commodities Research

We still expect supply growth to moderate through the balance of the summer and into the injection season. US maintenance should eventually arrive, while the YoY contribution from new projects naturally fades as facilities that started in 2025 approach their first anniversary. Golden Pass also continues to disappoint, with the facility running at around 30% of capacity compared to our prior expectation of roughly 80% in the summer and above 90% in the winter (**Figure 12**).

Most importantly, Qatar's ramp up remains measured and continues to take time, as we have argued since the onset of the conflict (**Figure 13**). Despite the announced reopening of Hormuz, we estimate Qatari utilization averaged only around 16% in June based on loading data. Adjusting for the observed Hormuz exits, the effective utilization was closer to 10%. The restart remains operationally complex and likely reflects both technical and security considerations. We maintain our ramp up profile and model Qatar reaching 83% utilization in August, which we view as the new normal excluding the two damaged trains, and running near that rate from September onward. We model utilization at 50% in July and 62% in August (**Figure 14**). Recent events, including the Ras Laffan explosion and attacks on Qatari LNG vessels, leave the risks to this timeline skewed towards delay rather than an earlier normalization and any material slippage that puts winter Qatari volumes at risk would have a significant impact on prices.

Paced Qatari restarts, slowing ex-Middle East supply growth, low Golden Pass utilization and resilient Asian demand leave Europe in a difficult position ahead of winter. Domestic fundamentals are also tight and under increasing stress. NWE storage is currently around 40% full, or at its lowest level on record for this time of year since 2013. Storage stood at 54% full at the same time last year, which was already the lowest level since 2022, and the gap versus last year keeps widening (**Figure 15**). At the end of winter, NWE storage was around 8 percentage points below last year. That gap has now widened to roughly 15 percentage points, reflecting ongoing weakness in LNG imports and sendouts, as well as weather-driven demand surprises from an unusually cold May and an unusually hot June.

Figure 15: NWE gas storage levels (2013-26)

Source: AGSI, GIE, Bloomberg Finance L.P., J.P. Morgan Commodities Research

These tight on the ground fundamentals are being exposed to further stress from what is shaping up to be the hottest summer on record. Hot weather raises cooling demand and overall power load, even in Europe where air conditioning penetration remains relatively low. It also pressures alternative power sources. Lower wind speeds have already weighed on wind generation, higher river temperatures have constrained nuclear output because of cooling requirements, and lower water levels have reduced run-of-river hydro generation ([European Natural Gas: Demand Storage Tracker: Summer swelter](#), 30 June 2026).

Even coal is exposed to weather-related risks, given Europe's reliance on river barges to transport coal across the Rhine-Main-Danube corridor. Rhine water levels are at multi-year seasonal lows and are already below 2022 levels. As a reminder, low river levels and coal transport constraints were one of the contributing factors behind the 2022 summer energy crisis, alongside extreme heat, lower nuclear availability, weaker renewable generation and reduced hydro output globally (**Figure 16**).

The ongoing deterioration in the storage trajectory, driven by weaker LNG imports and unseasonably strong demand during a very cold May and very hot June, alongside upside risk to power burns in remainder of the summer, leads us to revise our end Oct 2026 storage forecast from 80% to 75%. This would be one of the lowest levels on record, broadly in line only with Oct 2021 (**Figure 20**).

Figure 16: Rhine average river level

Average level across 20 points as measured and reported by BAFG (Bundesanstalt fuer Gewaesserku)
Source: BAFG, Bloomberg Finance L.P., J.P. Morgan Commodities Research

To us, this reflects the 3Q perfect storm we have been flagging ([European Natural Gas: The perfect storm](#), 11 June 2026). We think the market already appears to be acknowledging this emerging tightness. Following the ceasefire, energy prices sold off sharply, with oil moving from around \$90/bbl to \$80/bbl and then toward \$70/bbl, while TTF fell from around €50/MWh to €40/MWh before recovering toward €46/MWh at the time of writing (**Figure 17**).

Figure 17: Price moves since the beginning of the conflict in the Middle East (March 1)

%, 0=1 Mar 2026

Source: Bloomberg Finance L.P., J.P. Morgan Commodities Research

We reiterate our view that the market will require higher prices and wider TTF/JKM spreads for Europe to outbid Asia for spot LNG cargoes, incentivize the maximum feasible coal use in the power sector and ultimately correct the storage trajectory. Otherwise, if our 3Q view proves wrong and European storage continues to disappoint, the risk increases significantly into 4Q and winter.

This echoes last year's market setup (ex. Hormuz-related risks), when Europe either did not or could not attract enough LNG to correct its storage path despite low inventory levels throughout the injection season. NWE entered winter only 78% full, effectively relying on expected LNG supply growth and a structurally lower dependence on storage ([*European Natural Gas Outlook 2026/2027: Abundant US LNG drives lower prices and storage needs in Europe*](#), 20 November 2025). That approach contributed to a nearly 50% price spike in January during a short-lived transatlantic cold spell. If Europe again relies on winter LNG availability rather than correcting storage during the injection season, price moves could prove more significant.

A repeat of that strategy this year would leave Europe entering winter with even lower storage (potentially the lowest ever), already elevated prices, the usual winter weather risks, greater El Niño uncertainty and higher Hormuz related risks (at least compared to last winter). In that context, betting on El Niño to deliver a mild winter may prove too optimistic and could come at a high cost.

Import trends by country – Asia

Figure 122: Contracted vs imported LNG

Source: China Customs, Wood Mackenzie, Bloomberg Finance L.P. and J.P. Morgan Commodities Research

China

- In Jun-26 China's LNG imports were 7.3 Bcm (+10.4% m/m and +1.1% y/y)
- YTD in 2026, imports total 38.7 Bcm, or 6.1% lower compared to same period last year
- YTD in 2026, imports were 28.7% below contracted amount (2026 annual contracted volume prorated for YTD)
- YTD in 2026, import terminal capacity utilization rate is estimated at 27% (compared to 37% in the same period last year)

Disclosures

History of Investment Recommendations:

A history of J.P. Morgan investment recommendations disseminated during the preceding 12 months can be accessed on the Research & Commentary page of <http://www.jpmorganmarkets.com> where you can also search by analyst name, sector or financial instrument.

Analysts' Compensation: The research analysts responsible for the preparation of this report receive compensation based upon various factors, including the quality and accuracy of research, client feedback, competitive factors, and overall firm revenues.

Company-Specific Disclosures: Important disclosures, including price charts and credit opinion history tables (if applicable), are available for compendium reports and all J.P. Morgan-covered companies, and certain non-covered companies, by visiting <https://www.jpmm.com/research/disclosures>, calling 1-800-477-0406, or e-mailing research.disclosure.inquiries@jpmorgan.com with your request.

Other Disclosures

J.P. Morgan is a marketing name for investment banking businesses of JPMorgan Chase & Co. and its subsidiaries and affiliates worldwide.

UK MIFID FICC research unbundling exemption: UK clients should refer to [UK MIFID Research Unbundling exemption](#) for details of J.P. Morgan's implementation of the FICC research exemption and guidance on relevant FICC research categorisation.

J.P. Morgan Research may, from time to time, write on issuers or securities targeted by economic or financial sanctions imposed or administered by the governmental authorities of the U.S., EU, UK or other relevant jurisdictions (Sanctioned Securities). Nothing in this report is intended to be read or construed as encouraging, facilitating, promoting or otherwise approving investment or dealing in such Sanctioned Securities. Clients should be aware of their own legal and compliance obligations when making investment decisions.

Any digital or crypto assets discussed in this research report are subject to a rapidly changing regulatory landscape. For relevant regulatory advisories on crypto assets, including bitcoin and ether, please see <https://www.jpmorgan.com/disclosures/cryptoasset-disclosure>.

The author(s) of this research report may not be licensed to carry on regulated activities in your jurisdiction and, if not licensed, do not hold themselves out as being able to do so.

Exchange-Traded Funds (ETFs): J.P. Morgan Securities LLC ("JPMS") acts as authorized participant for substantially all U.S.-listed ETFs. To the extent that any ETFs are mentioned in this report, JPMS may earn commissions and transaction-based compensation in connection with the distribution of those ETF shares and may earn fees for performing other trade-related services, such as securities lending to short sellers of the ETF shares. JPMS may also perform services for the ETFs themselves, including acting as a broker or dealer to the ETFs. In addition, affiliates of JPMS may perform services for the ETFs, including trust, custodial, administration, lending, index calculation and/or maintenance and other services.

Options and Futures related research: If the information contained herein regards options- or futures-related research, such information is available only to persons who have received the proper options or futures risk disclosure documents. Please contact your J.P. Morgan Representative or visit <https://www.theocc.com/components/docs/riskstoc.pdf> for a copy of the Option Clearing Corporation's Characteristics and Risks of Standardized Options or https://www.finra.org/sites/default/files/2020-08/Security_Futures_Risk_Disclosure_Statement_2020.pdf for a copy of the Security Futures Risk Disclosure Statement.

Changes to Interbank Offered Rates (IBORs) and other benchmark rates: Certain interest rate benchmarks are, or may in the future become, subject to ongoing international, national and other regulatory guidance, reform and proposals for reform. For more information, please consult: https://www.jpmorgan.com/global/disclosures/interbank_offered_rates

Private Bank Clients: Where you are receiving research as a client of the private banking businesses offered by JPMorgan Chase & Co. and its subsidiaries ("J.P. Morgan Private Bank"), research is provided to you by J.P. Morgan Private Bank and not by any other division of J.P. Morgan, including, but not limited to, the J.P. Morgan Corporate and Investment Bank and its Global Research division.

Legal entity responsible for the production and distribution of research: The legal entity identified below the name of the Reg AC Research Analyst who authored this material is the legal entity responsible for the production of this research. Where multiple Reg AC Research Analysts authored this material with different legal entities identified below their names, these legal entities are jointly responsible for the production of this research. Where more than one legal entity is listed under an analyst's name, the first legal entity is responsible for the production unless stated otherwise. Research Analysts from various J.P. Morgan affiliates may have contributed to the production of this material but may not be licensed to carry out regulated activities in your jurisdiction (and do not hold themselves out as being able to do so). Unless otherwise stated below in the legal entity disclosures, this material has been distributed by the legal entity responsible for production, or where more than one legal entity is listed under the analyst's name, the first legal entity will be responsible for distribution. If you have any queries, please contact the relevant Research Analyst in your jurisdiction or the entity in your jurisdiction that has distributed this research material.

Legal Entities Disclosures and Country-/Region-Specific Disclosures:

General: Additional information is available upon request. The information in this material has been obtained from sources believed to be reliable. While all reasonable care has been taken to ensure that the facts stated in this material are accurate and that the forecasts, opinions and expectations contained herein are fair and reasonable, JPMorgan Chase & Co. or its affiliates and/or subsidiaries (collectively J.P. Morgan) make no representations or warranties whatsoever to the completeness or accuracy of the material provided, except with respect to any disclosures relative to J.P. Morgan and the Research Analyst's involvement with the issuer that is the subject of the material. Accordingly, no reliance should be placed on the accuracy, fairness or completeness of the information contained in this material. There may be certain discrepancies with data and/or limited content in this material as a result of calculations, adjustments, translations to different languages, and/or local regulatory restrictions, as applicable. These discrepancies should not impact the overall investment analysis, views and/or recommendations of the subject company(ies) that may be discussed in the material. Artificial intelligence tools may have been used in the preparation of this material, including assisting in data analysis, pattern recognition, and content drafting for research material. J.P. Morgan accepts no liability whatsoever for any loss arising from any use of this material or its contents, and neither J.P. Morgan nor any of its respective directors, officers or employees, shall be in any way responsible for the contents hereof, apart from the liabilities and responsibilities that may be imposed on them by the relevant regulatory authority in the jurisdiction in question, or the regulatory regime thereunder. Opinions, forecasts or projections contained in this material represent J.P. Morgan's current opinions or judgment as of the date of the material only and are therefore subject to change without notice. Periodic updates may be provided on companies/industries based on company-specific developments or announcements, market conditions or any other publicly available information. There can be no assurance that future results or events will be consistent with any such opinions, forecasts or projections, which represent only one possible outcome. Furthermore, such opinions, forecasts or projections are subject to certain risks, uncertainties and assumptions that have not been verified, and future actual results or events could differ materially. The value of, or income from, any investments referred to in this material may fluctuate and/or be affected by changes in exchange rates. All pricing is indicative as of the close of market for the securities discussed, unless otherwise stated. Past performance is not indicative of future results. Accordingly, investors may receive back less than originally invested. This material is not intended as an offer or solicitation for the purchase or sale of any financial instrument. The opinions and recommendations herein do not take into account individual client circumstances, objectives, or needs and are not intended as recommendations of particular securities, financial instruments or strategies to particular clients. This material may include views on structured securities, options, futures and other derivatives. These are complex instruments, may involve a high degree of risk and may be appropriate investments only for sophisticated investors who are capable of understanding and assuming the risks involved. The recipients of this material must make their own independent decisions regarding any securities or financial instruments mentioned herein and should seek advice from such independent financial, legal, tax or other adviser as they deem necessary. J.P. Morgan may trade as a principal on the basis of the Research Analysts' views and research, and it may also engage in transactions for its own account or for its clients' accounts in a manner inconsistent with the views taken in this material, and J.P. Morgan is under no obligation to ensure that such other communication is brought to the attention of any recipient of this material. Others within J.P. Morgan, including Strategists, Sales staff and other Research Analysts, may take views that are inconsistent with those taken in this material. Employees of J.P. Morgan not involved in the preparation of this material may have investments in the securities (or derivatives of such securities) mentioned in this material and may trade them in ways different from those discussed in this material. This material is not an advertisement for or marketing of any issuer, its products or services, or its securities in any jurisdiction.
