

China AIDCs and Supply Chain

Riding on robust demand for AI compute

Equities
IT Services

China

- ◆ We expect demand for AI compute in 2028e to be 5x that of 2025's level as model training and inference needs grow...
- ◆ ... benefiting leaders in AI data centres (AIDCs) and supply chain participants at various stages like switches
- ◆ Initiate on Range and Ruijie with Buy ratings in separate reports

Strong AI compute demand. We estimate China's AI compute demand to boom and reach c5GW by 2028, c5x more than 2025, driven by explosive demand for large language model training and inference. Domestic hyperscalers are rapidly boosting their capex, with the combined spending of ByteDance, Alibaba, and Tencent reaching RMB346bn in 2025 and set to more than double to over RMB700bn in 2026 (see [Ex 6](#)). This is still well below the spending intensity of US peers, indicating there's substantial growth potential. Leading AIDC operators and key supply chain participants (like switch vendors) should benefit.

AI network upgrades. We see the TAM for data centre switches – the high-speed traffic controllers of a network – reaching RMB118bn in 2030e, implying a 28% CAGR in 2025-30e, on 1) more layers being added to a network's structure given larger GPU clusters; 2) upgrades to switch port speed could boost product prices; and 3) scale-up switches (that connect GPUs within a rack) are new revenue drivers on rising penetration of SuperPOD. The shift to these SuperPOD cluster architecture raises technical barriers and boosts the value of specialised AIDC operators like Range whose market share we expect to reach 9% in 2028e vs 6% in 2025 in the domestic data centre space, and Ruijie's market share in China data centre switches should reach 24% in 2028e vs 21% in 2025.

Going global opportunities. Over the long term, domestic IDC operators have the potential to serve global inference demand via "token exports", leveraging China's model cost-efficiency, abundant low-cost green power in western China, and lower construction, mechanical and electrical equipment costs.

Prefer Range and Ruijie (both rated Buy). Benefiting from the AI compute boom, we expect robust AIDC revenue growth for Range, and a 43% 2025-28e EBITDA CAGR with improving margins. We expect Ruijie to gain market share in the fast-growing data centre switch market and expect its net margin to improve to 10% in 2028e vs 5% in 2025 given better economies of scale. See our initiation reports published today on [Range](#) and [Ruijie](#).

Robust demand, limited supply

- ◆ Strong token consumption brings robust demand for compute, benefiting AIDC players
- ◆ Price increases in the GPU rental business (GPUaaS) are likely to continue with leaders gaining market share
- ◆ Next step is for tokens to keep going global

Robust token consumption brings strong AIDC demand

AIDC is the core infrastructure for AI compute

We believe AIDC is one of the key sections in the AI compute supply chain. As the physical infrastructure of compute, AIDCs process data and connect hardware to software.

Exhibit 2. AI compute supply chain: Data centres are key infrastructure

Source: Company data, HSBC Qianhai Securities

Due to 1) strong AI demand and 2) limited GPU and AIDC capacity supply, the GPU rental (GPUaaS) business is quite popular in both China and US. Some traditional internet data centre (IDC)/AIDC players have moved into this business. We list several GPUaaS businesses below. In our view, GPUaaS provides multiple advantages compared to in-house built GPU infrastructure, including 1) easier/quicker access to high-end GPUs compared to self-built; and 2) less investment required as rental refers to Opex instead of Capex for enterprises.

Exhibit 3. Data centres and GPU leasing business model comparisons

Feature	Retail data centres	Wholesale / Hyperscale data centres	AI data centres	GPU rental (GPUaaS)	Neo-cloud (GPUaaS)	Hyperscale public cloud

Strong compute demand to drive accelerated growth; we expect China intelligent compute to grow at a CAGR of 74% over 2025-28e, reaching 5GW in 2028e

With more advanced model launches in 2026, token consumption has shown strong growth. Per National Data Administration, China's daily token consumption reached 140trn in March 2026, which is 40% more vs December 2025. In addition, IDC estimates that global agent token usage will grow to 152,667 peta (10^{15}) in 2030e, vs 0.0005 peta in 2025. The rising penetration of generative artificial intelligence (GAI) and robust token usage growth potential brings strong demand for AI compute, and hence, CSPs/Internet companies have raised their capex. Notably, per company guidance and media reporting, China hyperscalers' total capex in 2026e is set to more than double to over cRMB700bn (see [Ex 6](#)).

As GAI penetration is still in the early stages, we expect the strong compute demand to persist and expect China intelligent compute (@FP16, or 16-bit binary floating-point computer number format) to grow to over 12 ZFLOPS (10^3 EFLOPS) in 2028e, close to 8x vs 2025 level. In addition, we expect China intelligent compute data centre demand to grow at a CAGR of 74% over 2025-28e and to reach c5.4GW in 2028e. AIDC players that have more reserved/running capacity should benefit.

Exhibit 4. China daily token usage grew robustly over the last two years

Source: National Data Administration, HSBC Qianhai Securities

Exhibit 5. IDC estimates global agent token usage will grow to 152,667 peta in 2030e

Source: IDC estimates, HSBC Qianhai Securities

Exhibit 6. China CSPs continue to raise their capex

Source: Company data (capex guidance), Reuters (23 Dec 2025), Bloomberg (May 2026), South China Morning Post (9 May 2026), HSBC Qianhai Securities

Exhibit 7. We expect China intelligent compute to grow to c12,354 EFLOPS (@FP16) in 2028e

Source: MIIT, CAICT, IDC, HSBC Qianhai Securities estimates

Exhibit 8. We expect China intelligent compute data centre demand to grow at a CAGR of 74% over 2025-28e and to reach c5.4GW in 2028e

Source: MIIT, CAICT, IDC, Nvidia, HSBC Qianhai Securities estimates

Based on 1) our above forecast for China's intelligent compute data centre capacity and the compute scale and pricing of mainstream NVIDIA GPU servers/compute trays, etc.; and 2) Range's annual data centre operation revenue per MW, we expect China's data centre market to reach RMB165bn in 2028. Specifically, we expect the AIDC market to grow at a CAGR of 78% over 2025-28e, reaching RMB75bn on 2028e.

Exhibit 9. China third-party data centre TAM/growth

Source: MIIT, CAICT, IDC, Range company data, HSBC Qianhai Securities estimates

Supply is the bottleneck; leaders to gain market share

We expect AIDC to face supply shortages; GPUaaS should see robust growth

Due to strong AI demand and given limited GPU and AIDC capacity supply, since 2025, the GPUaaS market saw continued price hikes. Note that the Nvidia H100 rental price has risen from RMB12/GPU/hour to RMB17/GPU/hour, up c40%. Meanwhile, leading CSPs have announced cloud services price rises as well.

A new AIDC buildout usually needs 18-24 months for construction and utilisation ramp-up (source: Range company data). Per third party AIDC capacity plans, we expect supply shortages to continue, and the GPU rental business should see continued growth. AIDC players providing GPU leasing services (such as Range and Hec, per [Exhibit 3](#)), will continue to enjoy benefits from tight supply.

Exhibit 10. H100 1-year rental price has continued to rise since 2026

SuperPOD cluster architecture increases AIDC operators' value proposition

In the era of intelligent computing, cluster network communication bottlenecks have become the core constraint for both AI training and inference. However, a highly integrated SuperPOD architecture can break through bottlenecks related to scale, performance, and reliability. A SuperPOD is a technical architecture that aggregates multiple GPUs into a single SuperPOD in one rack via high-bandwidth interconnects, enabling large-scale parallel training.

This technological leap is driving new requirements for data centres in terms of cooling, power supply capacity, floor load-bearing capacity, ceiling height, and network architecture. Leading vendors with strong technical capabilities and capital resources are better positioned to secure SuperPOD data centre orders, leading to accelerated market share consolidation.

Moreover, the value proposition of SuperPOD data centres is expanding across multiple dimensions. Taking Range as an example, its AIDC business has not yet deployed SuperPOD solutions at scale, with high-performance servers remaining its primary equipment. However, its 2025 annualized revenue per MW of deployed capacity is already cRMB15m, representing a c56% increase compared to the cRMB9.6m generated by traditional IDC operation services. This provides early validation of the value uplift in AI data centres.

We believe that given the growing use of intelligent agents and large language models, data centres will evolve into “token factories”. Demand for long-context processing and high-concurrency throughput are intensifying, which is driving intelligent computing centres to enhance computing density, network bandwidth, and energy efficiency. AIDC service providers that possess sufficient energy quota reserves, high-bandwidth low-latency networks, liquid cooling technologies, and scalable operational and delivery capabilities will gain structural advantages during the industry upcycle and the ongoing shift in technical paradigms and are expected to continue benefiting in the long term.

Exhibit 14. SuperPOD brings higher requirements for data centre operators

	General purpose CPU cabinet	Traditional AIDC cabinet Example: DGX H100	Overseas SuperPOD AIDC cabinet Example: DGX GB300 NVL72	Domestic SuperPOD AIDC cabinet Example: Atlas 950 SuperPoD
Cabinet power	4-12kW	40kW	120kW	Over 120kW
Core components	CPU servers	4 DGX H100 servers + 3 PDUs	18 1U compute trays + 9 1U NVLink switch trays + 8 rackmount power supplies	N/A
Scale	N/A	32*H100 GPU	72*B300 GPU	64* Ascend 950DT NPU
Intelligent compute (EFLOPS @FP16)	N/A	0.06	0.72	4
Cooling method	Air-cooled	Air-cooled	Liquid-cooled	Liquid-cooled
Memory capacity	N/A		21TB HBM3e	9TB HBM HiZQ2.0
Interconnect bandwidth	N/A		576TB/s	16.3 PB/s
Power supply method	AC power distribution unit (PDU) installed at the top or sides of the cabinet	AC PDU installed at the top of the cabinet (power distribution unit), typically with AC 220V/380V input. Power distribution: Each server has its own power supply module (PSU), converting AC to DC (typically to 12V)	High-voltage DC (HVDC), with redundant power shelves built into the cabinet, typically outputting 48V or 50V DC	
Floor load and space requirements for data centre	Floor load typically 800–1000 kg/m ² , ceiling height typically 4-5m	Floor load typically >1000 kg/m ² , ceiling height typically >6 m	Cabinet weight exceeds 1 ton, with cable, cooling pipe, and power equipment volume and weight increasing significantly, requiring higher floor load capacity and ceiling height

More upside to come: global expansion

AIDC operators: key beneficiaries of domestic LLMs going global

China's leading AIDC operators have expanded into overseas markets to help support domestic CSPs' overseas compute demand. In this AI era, with more advanced domestic LLMs gaining market share in the overseas markets, we believe AIDC operators are major beneficiaries.

Exhibit 17. Weekly AI token usage on OpenRouter has surged since 2026

Exhibit 18. Chinese models have gained token share from US models since February 2026

Exhibit 19. Top Chinese models perform well in the Intelligence Index at lower costs

Exhibit 20. Top Chinese models' blended API cost is only c20% of US models'

Exhibit 21. Mainland Chinese data centre vendors are actively expanding offshore

Ticker	Company	Offshore in-service capacity (MW)	Offshore long-term capacity plan (MW)	Locations
300442 CH	Range	0	600	Hong Kong (240MW) Indonesia Batam (360MW)
600673 CH	Chindata (HEC)	c200	N/A	Johor (Malaysia), Kuala Lumpur (Malaysia), Bangalore (India), Thailand, Singapore
9698 HK	DayOne (GDS)	c440	2,700	Singapore, Thailand, Johor (Malaysia), Indonesia Batam, Japan, Hong Kong, Finland

Source: Company data, HSBC Qianhai Securities estimates

Tokens going global to also benefit AIDC operators

As mentioned earlier, China not only has leading cost efficiency models, but also enjoys cheaper electricity price (see [Ex 32](#)). With the narrowing performance gap between Chinese models and US models, domestic AI model suppliers have the potential to sell tokens in the overseas markets over the long term, which also should benefit domestic AIDC vendors.

Exhibit 22. Models going global and tokens going global

	Model going global	Token going global
Location of computing	Overseas	China
Latency	Low	Higher (cross border network latency)
Data compliance	Natively compliant	Complex, user data cross borders
Advantages for LLM suppliers	Better access to advanced accelerators	Lower cost on data centre electricity, civil works, mechanical and electrical equipment

Source: HSBC Qianhai Securities

GPUaaS: China vs US

- ◆ In terms of CSP capex, China has significant upside
- ◆ China has energy/cost advantage; US has more high-end GPUs
- ◆ In this chapter, we compare various GPUaaS operating metrics

GPUaaS refers to general GPU leasing, a concept that has attracted investor attention in both China and the US due to continued price hikes. In this section, we dig into the GPUaaS market in both markets.

CSP capex: China has significant upside

ByteDance, Alibaba and Tencent together guided for 2026e capex to be over cRMB700bn (see [Ex 6](#)) (cUSD111bn), c16% of US hyperscalers' capex, showing substantial growth potential. We believe the GPUaaS market in China is at an early stage, and rising AI penetration should drive robust growth for years.

Exhibit 23. China hyperscalers' capex shows a substantial gap compared with US peers in terms of absolute numbers ...

Source: Company data (China hyperscalers' capex guidance), Reuters (23 May 2025), Bloomberg (27 May 2026), South China Morning Post (27 May 2026), Bloomberg consensus estimates (US hyperscalers' capex), HSBC Qianhai Securities

Exhibit 24. ... and in terms of % of revenue and operating cash flow

Source: Company data (China hyperscalers' capex guidance), Reuters (23 May 2025), Bloomberg (27 May 2026), South China Morning Post (27 May 2026), Bloomberg consensus estimates (revenue, operating cashflow, US hyperscalers' capex), HSBC Qianhai Securities

Exhibit 28. Annualised revenue per MW US vs China

Source: Company data, HSBC Qianhai Securities

China has energy/cost advantages; US has high-end GPU supply

China's "Eastern data, Western compute" policy has shifted data centre supply from eastern China to western China. Meanwhile, the "compute power coordination" policy has gradually guided data centre building to regions with rich green power supply. That said, China's AIDCs should have energy and cost advantages over US peers, especially when competing in the global market.

Green power price in Western China is c50% lower than the US industrial power price

For foundation model vendors, China's data centre buildings, civil engineering and electricity costs are generally lower than in the US. China's western electricity price was c50% lower than the US average industrial electricity price in 2025.

Exhibit 29. China data centre electricity consumption only accounted for 1.9% of total electricity consumption in 2025

Source: NEA, CAICT, HSBC Qianhai Securities

Exhibit 30. US data centre electricity consumption accounted for 7.7% of total in 2025

Source: US EIA, Wind, HSBC Qianhai Securities

Exhibit 31. Average price of electricity to industrial consumers in US has risen over the last two years and reached USD0.0862/kWh in 2025

Source: EIA, HSBC Qianhai Securities

Cost-effectiveness of domestic GPUs is improving; US has access to advanced GPUs

GPU supply remains tight in China due to US export controls on high-end GPUs, resulting in higher GPU server procurement costs in China versus the US. However, in the long term, we believe that as cloud vendors' self-developed ASIC (application-specific integrated circuit) chip supply increases and domestic substitution of high-performance computing chips progresses, domestic IT equipment costs, including servers, may approach US levels, while cost advantages from cheaper buildings and electricity will become increasingly pronounced.

Exhibit 35. Under equivalent compute, the price of domestic GPUs is getting closer to that of NVIDIA

Source: Nvidia, Huawei, 36Kr, HSBC Qianhai Securities

Exhibit 36. Currently, the China GPU rental rate is close to the low end pricing of overseas peers

Source: Nebius, Glory View, HSBC Qianhai Securities

North American neo-cloud vendors, like Nebius and Coreweave, have relatively sufficient supply of compute and develop and build their own hypervisor layer, a software layer beyond the bare metal GPU server, designed specifically for massive AI training and inference on top of GPU servers. This approach involves higher technical barriers, and as a result, their gross profit margins can reach around 70% with over 60% EBITDA margins in a mature stage.

China's GPU leasing leaders' core moat lies in scarce GPU supply-chain access given the US export controls. The gross margin of China's GPU leasing vendors is around 20%-30%, with a net profit margin of 10%-15%. The sector is now exploring new business models, shifting from fixed rental fees to token-throughput-based revenue sharing. This specific revenue-sharing business model and whether they can successfully transition remains to be seen. If successful, it could potentially improve the industry's gross and net profit margins.

Exhibit 37. US neo-cloud vendors are in a net loss position due to large depreciation and amortisation costs...

Source: Coreweave, Nebius, HSBC Qianhai Securities

Exhibit 38. ... but their adjusted EBITDA margin could reach over 60%

Analyst Certification

The following analyst(s), economist(s), or strategist(s) who is(are) primarily responsible for this report, including any analyst(s) whose name(s) appear(s) as author of an individual section or sections of the report and any analyst(s) named as the covering analyst(s) of a subsidiary company in a sum-of-the-parts valuation certifies(y) that the opinion(s) on the subject security(ies) or issuer(s), any views or forecasts expressed in the section(s) of which such individual(s) is(are) named as author(s), and any other views or forecasts expressed herein, including any views expressed on the back page of the research report, accurately reflect their personal view(s) and that no part of their compensation was, is or will be directly or indirectly related to the specific recommendation(s) or views contained in this research report: Yiran Liu and Heng Zhang

Important disclosures

Equities: Stock ratings and basis for financial analysis

HSBC and its affiliates, including the issuer of this report ("HSBC") believes an investor's decision to buy or sell a stock should depend on individual circumstances such as the investor's existing holdings, risk tolerance and other considerations and that investors utilise various disciplines and investment horizons when making investment decisions. Ratings should not be used or relied on in isolation as investment advice. Different securities firms use a variety of ratings terms as well as different rating systems to describe their recommendations and therefore investors should carefully read the definitions of the ratings used in each research report. Further, investors should carefully read the entire research report and not infer its contents from the rating because research reports contain more complete information concerning the analysts' views and the basis for the rating.

From 23rd March 2015 HSBC has assigned ratings on the following basis:

The target price is based on the analyst's assessment of the stock's actual current value, although we expect it to take six to 12 months for the market price to reflect this. When the target price is more than 20% above the current share price, the stock will be classified as a Buy; when it is between 5% and 20% above the current share price, the stock may be classified as a Buy or a Hold; when it is between 5% below and 5% above the current share price, the stock will be classified as a Hold; when it is between 5% and 20% below the current share price, the stock may be classified as a Hold or a Reduce; and when it is more than 20% below the current share price, the stock will be classified as a Reduce.

Our ratings are re-calibrated against these bands at the time of any 'material change' (initiation or resumption of coverage, change in target price or estimates).

Upside/Downside is the percentage difference between the target price and the share price.

Prior to this date, HSBC's rating structure was applied on the following basis:

For each stock we set a required rate of return calculated from the cost of equity for that stock's domestic or, as appropriate, regional market established by our strategy team. The target price for a stock represented the value the analyst expected the stock to reach over our performance horizon. The performance horizon was 12 months. For a stock to be classified as Overweight, the potential return, which equals the percentage difference between the current share price and the target price, including the forecast dividend yield when indicated, had to exceed the required return by at least 5 percentage points over the succeeding 12 months (or 10 percentage points for a stock classified as Volatile*). For a stock to be classified as Underweight, the stock was expected to underperform its required return by at least 5 percentage points over the succeeding 12 months (or 10 percentage points for a stock classified as Volatile*). Stocks between these bands were classified as Neutral.

*A stock was classified as volatile if its historical volatility had exceeded 40%, if the stock had been listed for less than 12 months (unless it was in an industry or sector where volatility is low) or if the analyst expected significant volatility. However, stocks which we did not consider volatile may in fact also have behaved in such a way. Historical volatility was defined as the past month's average of the daily 365-day moving average volatilities. In order to avoid misleadingly frequent changes in rating, however, volatility had to move 2.5 percentage points past the 40% benchmark in either direction for a stock's status to change.

Rating distribution for long-term investment opportunities

As of 31 March 2026, the distribution of all independent ratings published by HSBC is as follows:

Buy	59%	(12% of these provided with Investment Banking Services in the past 12 months)
Hold	36%	(12% of these provided with Investment Banking Services in the past 12 months)
Sell	6%	(6% of these provided with Investment Banking Services in the past 12 months)

For the purposes of the distribution above the following mapping structure is used during the transition from the previous to current rating models: under our previous model, Overweight = Buy, Neutral = Hold and Underweight = Sell; under our current model Buy = Buy, Hold = Hold and Reduce = Sell. For rating definitions under both models, please see "Stock ratings and basis for financial analysis" above.

For the distribution of non-independent ratings published by HSBC, please see the disclosure page available at <http://www.hsbcnet.com/gbm/financial-regulation/investment-recommendations-disclosures>.

To view a list of all the independent fundamental ratings/recommendations disseminated by HSBC during the preceding 12-month period, and the location where we publish our quarterly distribution of non-fundamental recommendations (applicable to Fixed Income and Currencies research only), please use the following links to access the disclosure page:

- 14 HSBC Qianhai Securities Limited holds 1% or more of a class of common equity securities of this company.

HSBC and its affiliates will from time to time sell to and buy from customers the securities/instruments, both equity and debt (including derivatives) of companies covered in HSBC Research on a principal or agency basis or act as a market maker or liquidity provider in the securities/instruments mentioned in this report.

Analysts, economists, and strategists are paid in part by reference to the profitability of HSBC which includes investment banking, sales & trading, and principal trading revenues.

Whether, or in what time frame, an update of this analysis will be published is not determined in advance.

Non-U.S. analysts may not be associated persons of HSBC Securities (USA) Inc, and therefore may not be subject to FINRA Rule 2241 or FINRA Rule 2242 restrictions on communications with the subject company, public appearances and trading securities held by the analysts.

Economic sanctions laws imposed by certain jurisdictions such as the US, the EU, the UK, and others, may prohibit persons subject to those laws from making certain types of investments, including by transacting or dealing in securities of particular issuers, sectors, or regions. This report does not constitute advice in relation to any such laws and should not be construed as an inducement to transact in securities in breach of such laws.

For disclosures in respect of any company mentioned in this report, please see the most recently published report on that company available at www.hsbcnet.com/research. HSBC Private Bank clients should contact their Relationship Manager for queries regarding other research reports. In order to find out more about the proprietary models used to produce this report, please contact the authoring analyst.

Additional disclosures

- 1 This report is dated as at 23 June 2026.
- 2 All market data included in this report are dated as at close 18 June 2026, unless a different date and/or a specific time of day is indicated in the report.
- 3 HSBC has procedures in place to identify and manage any potential conflicts of interest that arise in connection with its Research business. HSBC's analysts and its other staff who are involved in the preparation and dissemination of Research operate and have a management reporting line independent of HSBC's Investment Banking business. Information Barrier procedures are in place between the Investment Banking, Principal Trading, and Research businesses to ensure that any confidential and/or price sensitive information is handled in an appropriate manner.
- 4 You are not permitted to use, for reference, any data in this document for the purpose of (i) determining the interest payable, or other sums due, under loan agreements or under other financial contracts or instruments, (ii) determining the price at which a financial instrument may be bought or sold or traded or redeemed, or the value of a financial instrument, and/or (iii) measuring the performance of a financial instrument or of an investment fund.
- 5 This report may be a translation of a report authored in another language. If so, and if there is any discrepancy between versions, the original-language version shall prevail.
